

Spring 2024 Triton AI - UAV Search and Report Project Overview Feedback Metrics -

How would you rank this team's presentation?

Do you think that this team will accomplish their goals by the end of the quarter?

Short Response Feedback -

What feedback do you have for the presenter(s)?

The hardware is the toughest part, so good luck! But this is a cool project
Seems like something both applicable and doable in the time frame, good luck

detailed and good

Good use of diagram to describe the problem being solved, possibly have more specific requirements and goals.

I liked the diagrams. I wish they were clear on the rest of the overarching project.

Good. Clear direction. Looks feasible.

Look more at the audience, but otherwise very concise and easy to follow

Spent most of their time looking at their presentation and rarely looked at audience.

effectively communicated the goals and scope of the project

Understandably had to look at the presentation a lot to refer to the diagrams but made it a bit awkward. Great projection I could hear regardless of where you were facing.

clearly said, concise, im curious about what algorithm and inputs youll use

Very clear about methods and deliverables

You did a great job on explaining the problem that you are supposed to solve in the competition. Your slides has very few words so it is very easy to follow.

Interesting drone project with hardware and algorithm challenges.

The presentation was well spoken and succinct. However, I think the presenter should use less buzz/filler words. Overall, the images used were very helpful in understanding the mission of their drone.

I think the diagrams were very helpful and made it quite clear as to what the nature of the project itself is. I do think more about the background of the project could be useful here to lead into your task.

maybe a bit more baackground on your specific responsibilities

good and clear intro explanation of the steps and situations planned to execute. Good description of the tasks and what they expect the challenges they'll face will be

The presenter projected his voice very well, although he may have looked at the slides and Professor Jacobs more often than the rest of the class.

Spoke clearly good job

Maybe focus on specific milestones because it's a pretty big project

The visual in the second slide is a bit confusing; some of the symbols are unclear with no label IMO.

Eye contact could be better, the speaker looked too much at the slides. However, the actual content of the presentation was well organized and clearly spoken.

Maybe not stand in one place the whole time.

Slides were a little bit confusing to understand - a more clear overview would have been helpful.

Used "uhh" a lot. Not a lot of hand and feet movement but good loud voice

Nice presentation but a little too fast.

The image on second slide is good to understand

The presentation can be more structured

Explained the scenario and environment where drone will be used well.

Very well presented and I liked that the slides were short and to the point.

Good presentation, good visuals that conveyed what they want to achieve, could have made it a tiny bit more interesting, lot of challenges to encounter, would love to see the final product though

Could be a little louder, good hand movement.

I would like to hear more about the problem being solved

What are your key takeaways from the presentation?

Implement a search algorithm in their UAV

Nothing significant

they are going to do something about robot

Mainly algorithm design to optimally solve a solution for a challenge.

That they are creating a drone to search and report the surrounding.

Workflow for drone. Detects objects in field.

Robotx vision tracking challenge is very interesting and a lot of opportunities to learn

Great explanation of project specification (using embedded systems for UAV drone) and great visuals

hard project

Creating a search algorithm in order to enter the RobotX challenge
drone will search for objects and then land in specified path over water. search
algorithm will be used.

Seems like they have a good sense of what they want to do, didn't go too much in depth
about how they will accomplish it

Making a drone that can find the spots and communicating where those spots are.

A traditional embedded project with drones. Good luck.

Key takeaways I had from the presentation is that it is helpful to have summary points at
the end to help the audience remember the goals and challenges.

I understand the deliverables and the focus on the RobotX Challenge, which is what this
project is focusing on.

generally seems like some contributions to RobotX but not too specific

cool robotics project that will be a part of the competition in November

They are a part of a larger team at Triton AI, tasked with a particular task with the UAV
(drone) flying from a location to another, conducting a search and report operation.

Drone launch and search for two objects and report and land and project feature is the
search algorithm

The project is working with a drone and embedded system and implement a search
algorithm

This project will be entered into the RobotX challenge, which is nice to help outline the
deliverables for the project.

A cool project with a clear end goal.

build a drone for a competition

Their big challenge is mostly software and they will be participating in a competition.

They are building a UAV for a competition

The idea is interesting.

Use of drones for assistance

To develop a workflow for the drone to detect and localize the objects (boats)

Liked how you broke down challenges and rewards, Seems like a really cool project, cou

I wish you guys luck in the competition!

The point of the project and some of the engineering that will go into the project

Using drones to launch search missions

Uses LiDAR and CV.

The drone is being programmed to search the water
